

Accessibility

What

...Web accessibility means that people with disabilities can perceive, understand, navigate, and interact with the Web, and that they can contribute to the Web...

—<https://www.w3.org/WAI/intro/accessibility.php>

Context

- Age-related impairments
- Multiple disabilities
- Health conditions
- Changing abilities
- Temporary impairments
- Situational limitations

Primary Considerations

- Auditory
- Cognitive and neurological
- Physical
- Speech
- Visual
- Communication
- Language

“Web accessibility encompasses all disabilities that affect access to the Web, including visual, auditory, physical, speech, cognitive, and neurological disabilities.”

— <https://www.w3.org/WAI/intro/accessibility.php>

<https://www.w3.org/WAI/intro/people-use-web/diversity#diversity>

Why Accessible?

- Because you should
- You will get more users
- Google can read your site better, so you will have a more relevant listing in search results (and probably higher)
- If you receive government funding you are legally obligated to follow accessibility guidelines
- If you follow universal design principles, your site could improve for lots of people

Progressive Enhancement

what, why

Layers

1. HTML & Content (alt tags on images)
2. CSS (presentation, visual)
3. Javascript (interaction, animation + visual)

Designing in layers

peel off layer 3 and layers 2 and 1 should still work

Why

- Provides accessibility for screenreader usage
- Much better browser compatibility
- Support slow internet connections
- Google can read your site, so you get good SEO

including different version releases

there are literally thousands of different browsers, with different capabilities in use

you cannot test all of them

Example

<http://massart.andrewringler.com/web1-f16/materials/examples/wk6/0-owlcarousel-progressive-enhancement/index.html>

progressive enhancement example (in safari)

disable javascript, & styles

show what it looks like and behaves as you add back

listen to page with screen reader

show what images without alt text sound like

Testing

multiple browsers and with different users

Why Test

- You will improve your website
- Your users use a LOT of different web browsers

lot of diversity

http://caniuse.com/usage_table.php

Top three are firefox, Chrome and opera

Test Locally

Safari
Chrome
Firefox

download older versions of some

<https://ftp.mozilla.org/pub/mozilla.org/firefox/releases/>

Test With Phone

Test on Phone
and tablet if you have

Virtual Machines

- IE virtual machines: <https://www.modern.ie>
- <http://browsershots.org/>

either install your own, or use a web-based tool

Testing with Users

- Test your website with a variety of users, observe them, and ask for feedback

and finally, always test your website with a variety of users. observe them interacting with your website, and ask for feedback.

Screenreaders

multiple browsers

Today's Focus

- Auditory
- Cognitive and neurological
- Physical
- Speech
- **Visual**
- Communication
- Language

Screenreader usage will just tackle one aspect of visual disability. But, hopefully this exercise will build general awareness for the importance of considering these aspects, and testing, testing ,testing.

Screenreaders + Low-Vision

Kyle talks about screenreader and low-vision computer access

Extra Slides

Screenreader Platforms

- Windows is the laptop/desktop platform of choice for 85% of screenreader users
- the iPhone is the phone of choice for 69% of screenreader users

85% of screenreader users use Windows on their desktop and 69% use an iPhone

IE, a typical user will use Windows for their Laptop, and iPhone for their phone.

why, in my opinion, Windows has better support for low-vision and screenreader usage. And the iPhone was the first, and only phone with screenreader support for a long time, and probably is still the best.
